Kurtis graduated from the University of Wolverhampton in 2012 with a BSc (Hons) in Mathematics.

Why did you decide to study maths at the University of Wolverhampton?

This is a weird one, as I actually feel that fate had a lot to do with me studying mathematics here. I'm so glad this happened or else I could have ended up studying something like law at another university, which would have been terrible as I love numbers and would have missed the experience I had at the University of Wolverhampton.

Which aspects of the degree did you enjoy most?

My most enjoyable aspect of this degree has to be the different people you meet. I expected all maths students to fit a certain image. I was pleasantly surprised by meeting many people from different walks of life. This is really what university is all about!

What's a typical day at work like for you?

When working for yourself, each day is rarely ever the same. One day I could be designing a new item, another day I may be editing photos for promotional use, and on another day I could be dealing with the accounts of the company.

What advice would you give to students thinking about studying a mathematics degree at the University of Wolverhampton?

Make sure that you're prepared for the hard work it's going to take. It will be worth it though, mathematic degrees are very well considered and can give you different avenues for many different career paths.
